Automated operations in Changchun station

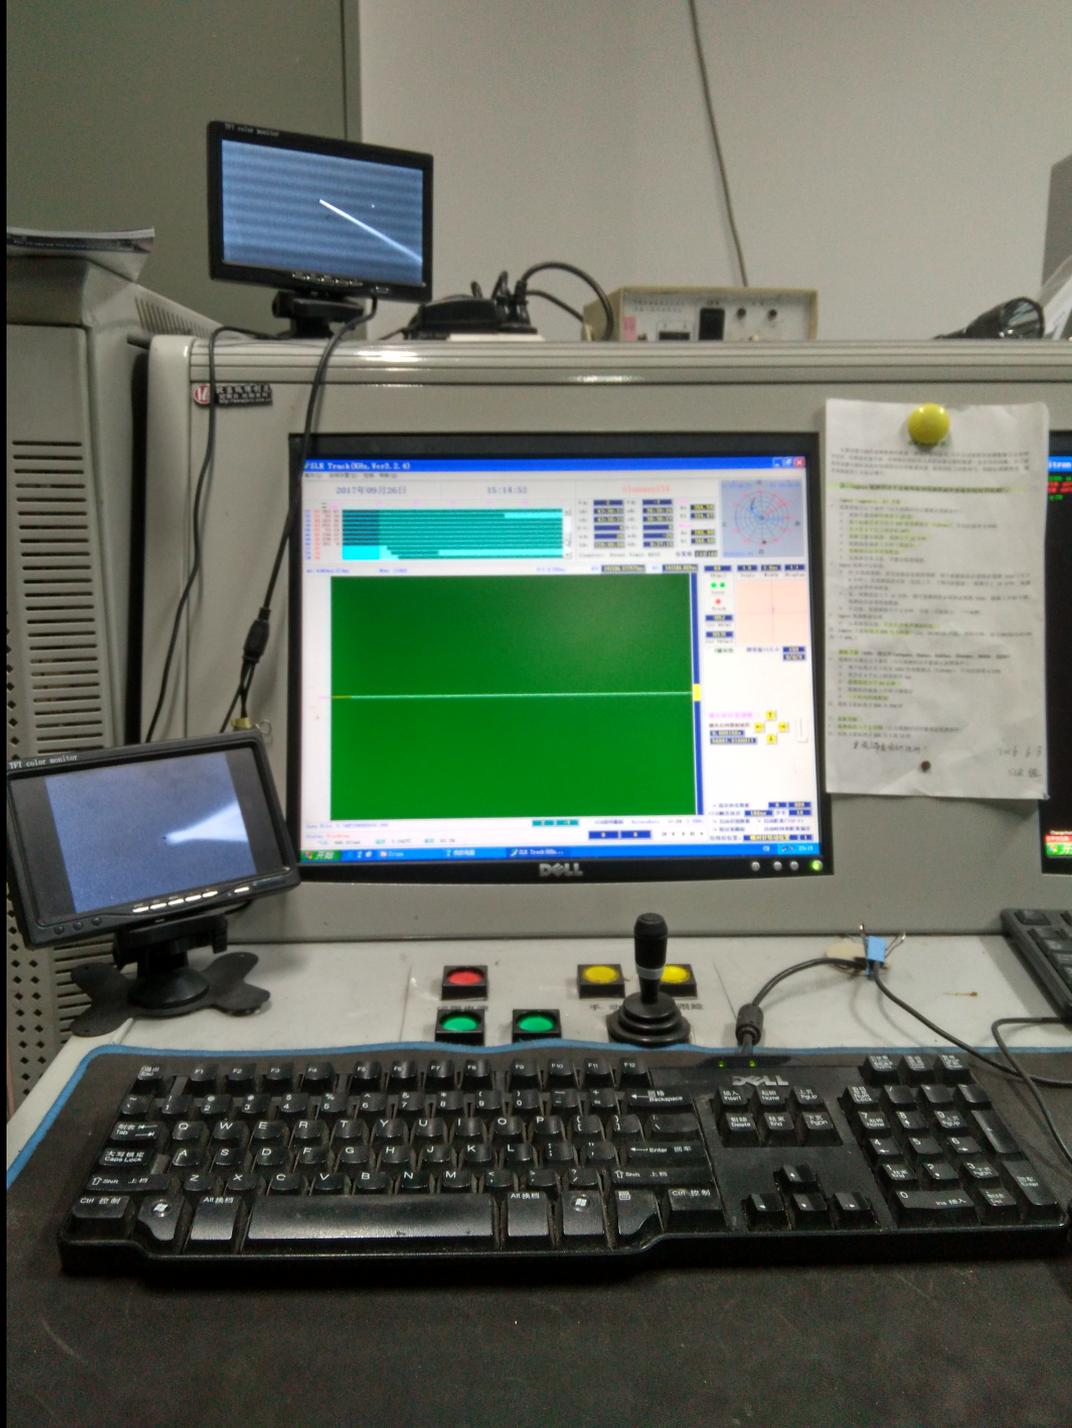

Part I : **Current**

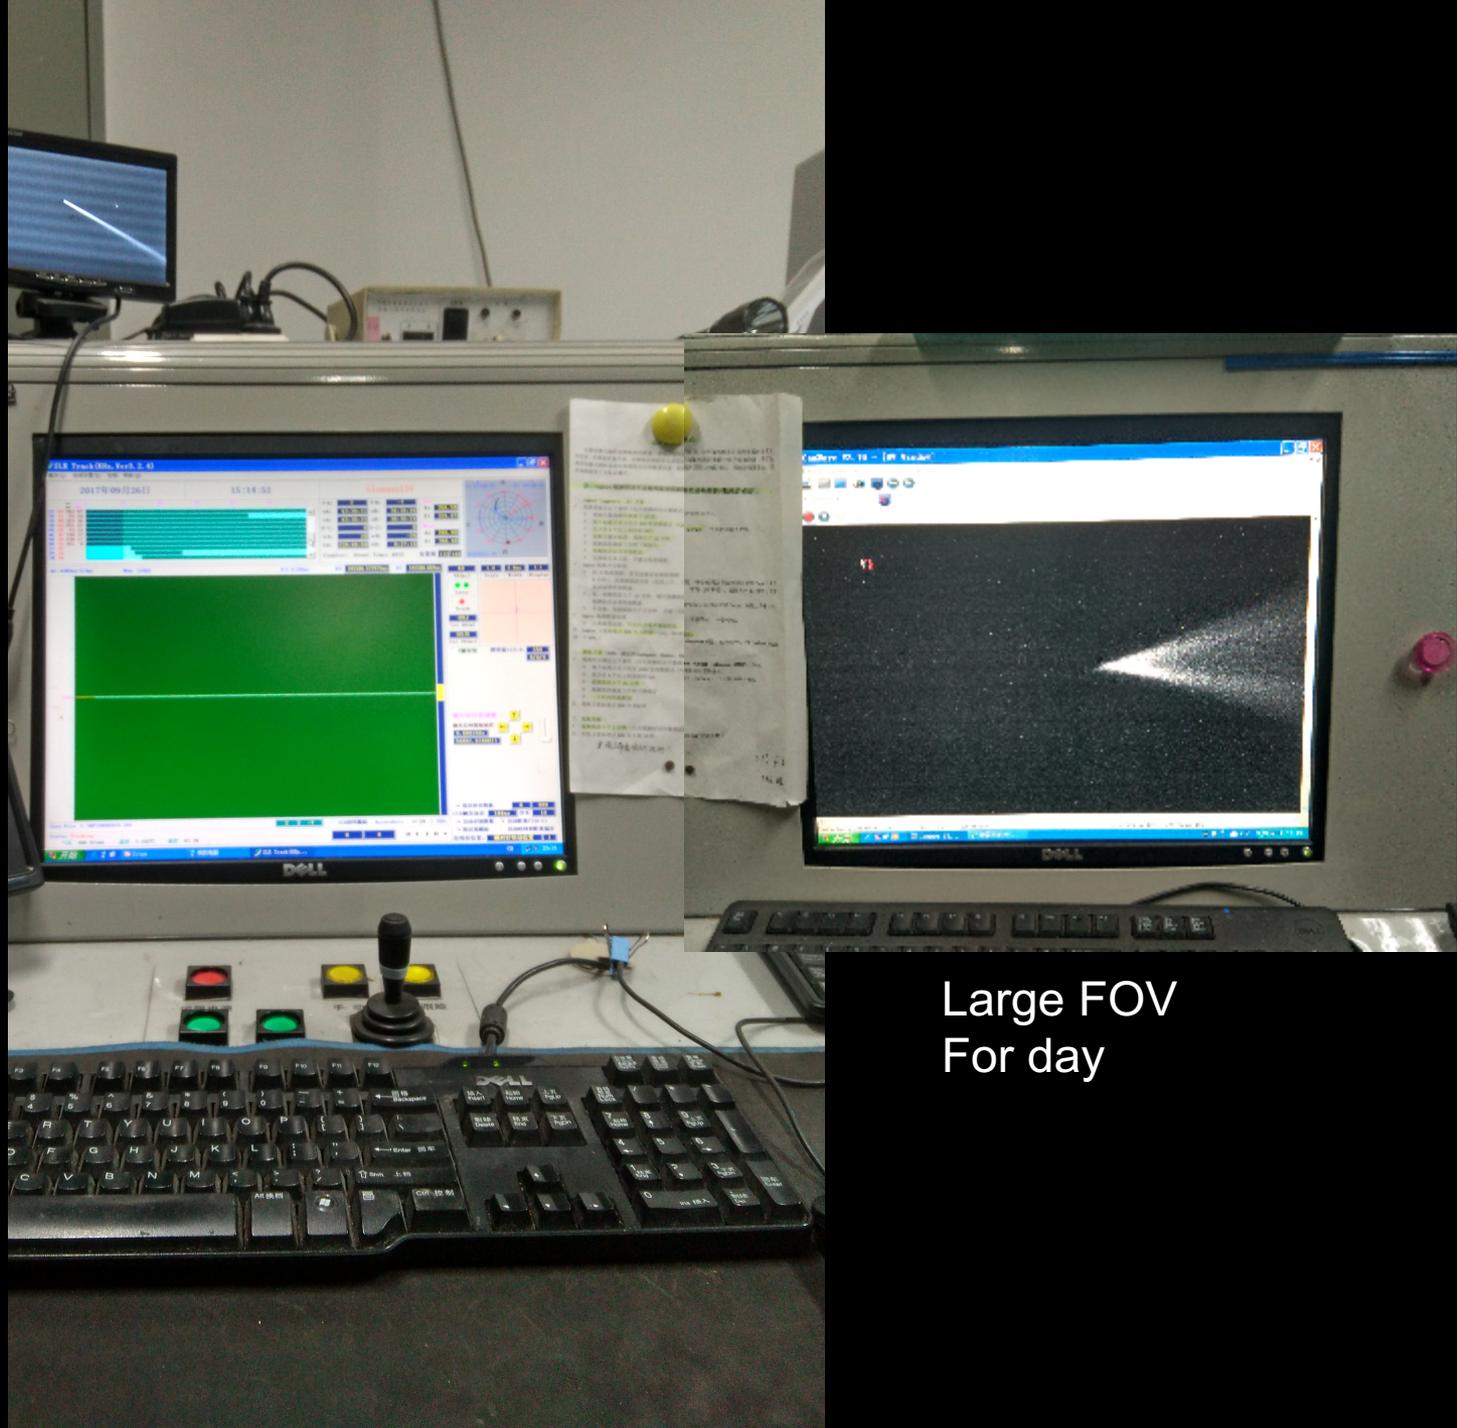

Zhipeng LIANG, Chengzhi LIU, Xingwei
HAN, Cunbo FAN, Xue DONG

Outline: Current

- Real-time data recognition
 - Range-gate following function
 - Daylight laser beam monitoring
 - Daylight pointing improvement
-

Small FOV
For night

Large FOV
For day

Real-time data recognition

- Useful in knowing echo number
 - Require good prediction
 - Mechanism: data points cluster in narrow range interval
 - Problem
 - False-alert in heavy noise
 - No-alert for very weak signal
 - Not accurate in number of points
-

Range-gate following function

- Useful for SPAD and bad prediction
 - Require data recognition
 - Range-gate follows echo
 - To adapt for rapid changes in range
 - To maintain echo position in range gate
 - Solve for real-time $TB+RB$ to compensate rapid change of range offset
-

Daylight laser beam monitoring

- Uses high speed camera and 532nm filter
- Trigger frame snapshot by fire signal
- Accumulate 1000 frames of 50us images
- Final frame rate ~ 1 fps
- Use Polaris to setup mark point

S/W x: 074 y: 277 Value: 2660

Daylight pointing improvement

- Useful in daylight operation
- Use 'good' satellites as reference:
 - LAGEOS', starlette/stella, some HEOs
- Require good prediction
 - True(1 arcsec x 1000km = 5m)
- Keep good beam position
 - With beam monitor.

9.2) $(100\text{ft}, 577)$ $(101\text{ft}, 584)$
 $(-52, 4)$ 东 $(1027, 883)$

Daylight pointing improvement

- Useful in daylight operation
 - Use 'good' satellites: lageos', startlette/stella, HEOs
 - Require good prediction
 - Keep good beam position
 - With beam monitor.
 - Implementation: offset matrix
 - Problem: lack data on sun-lit part of sky
-

Thank you!

Paldies
谢谢
