Automated operations in Changchun station

Part II : **Plans**

Zhipeng LIANG, Chengzhi LIU, Xingwei
HAN, Cunbo FAN, Xue DONG

Outline: Plans

- Target screen-locking
 - Laser beam screen-locking
 - Echo rate optimizing
 - Experience implementing automation
-

Target screen-locking

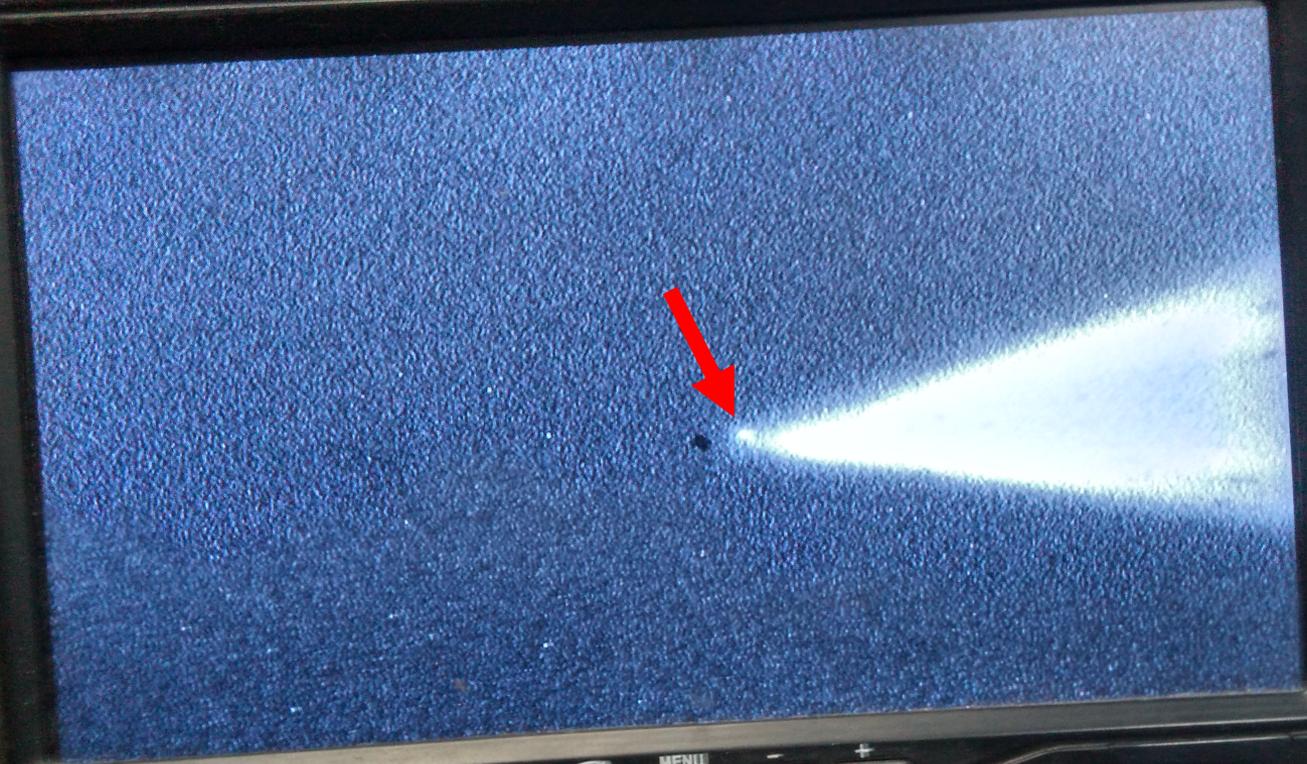

- Target isolation

- Use spectral filter to block laser backscatter
- Discriminate from background

- Point ahead

- Important for far targets
 - Let laser point ahead from target
 - Amount to be determined from prediction or line search
-

TFT color monitor

V1/V2

Laser beam screen-locking

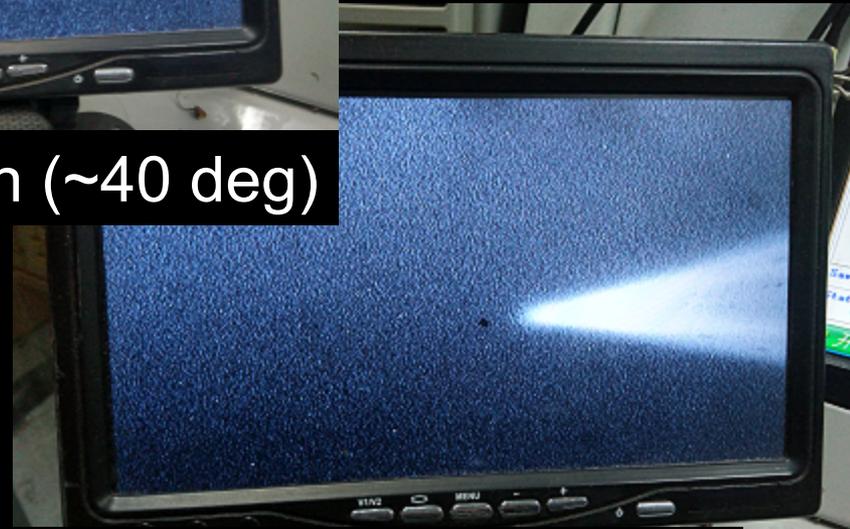

- Beam isolation
 - Spectral band-pass filter @532nm
 - Determine beam tip
 - Beam shape
 - Changes by elevation (atmosphere length)
 - Changes by atmosphere state
-

High Elevation (~70 deg)

Medium Elevation (~40 deg)

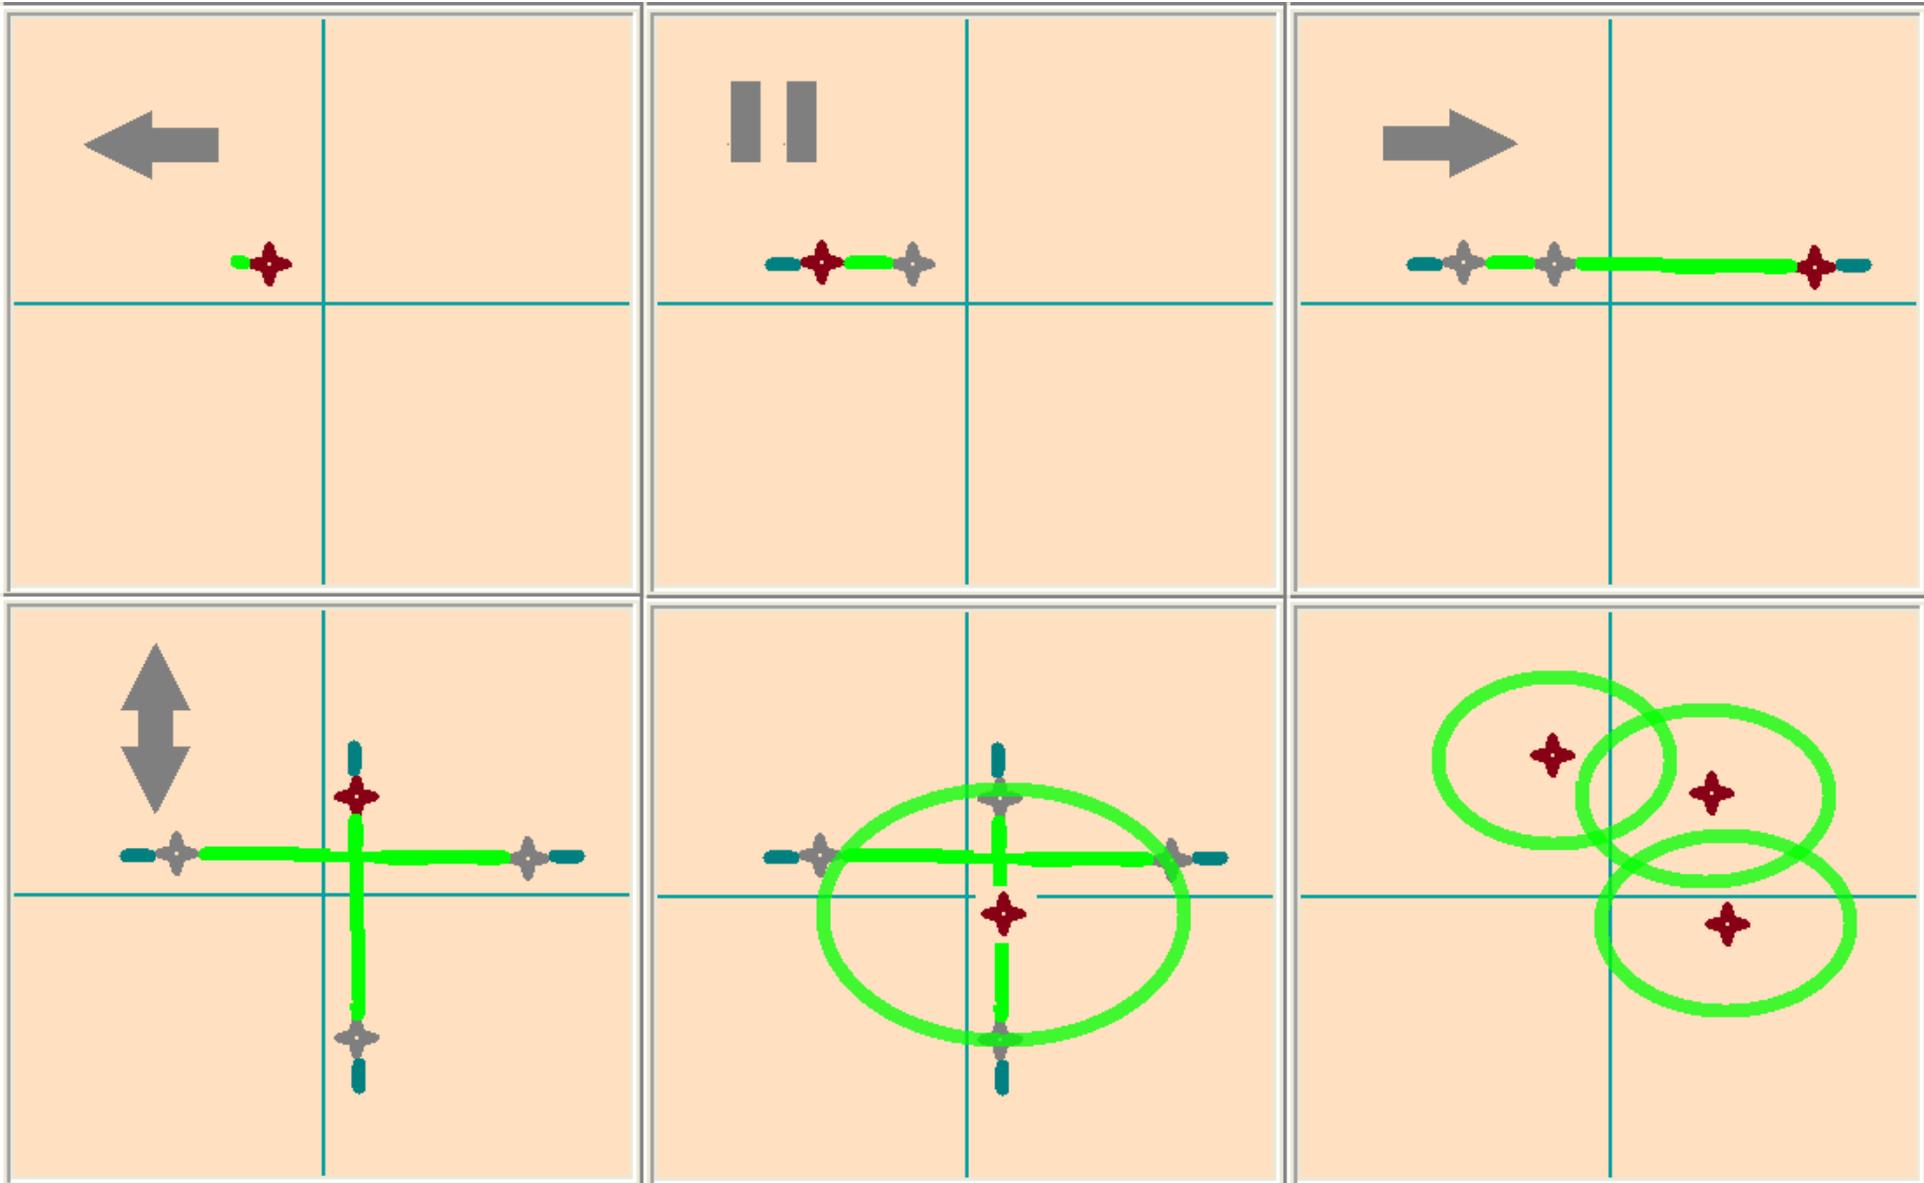

Low Elevation (~20 deg)

Echo rate optimizing

- Target drifts by pointing error
 - Inspired by Beam Divergence Measurement Procedure
 - Require beam locking
 - Offset target in laser-lit area
 - Laser-lit area is ellipse in Az-El offset frame
 - Find laser beam center repeatedly
 - Follow and stay in the ellipse
-

Echo rate optimizing

Experience implementing automation

- Steps to develop new scheme
 - First try it by hand
 - Let everyone do it, form procedure
 - Make computer software
 - Make it a sport!
-

Thank you!

Paldies

谢谢
