Abstract

We are reporting on the possibility of echo signal strength monitoring in the C-SPAD based laser ranging systems. The operating principle and the experimental results will be presented. The Signal Strength Monitor SSM has been incorporated into the Portable Pico Event Timer 2k. The stand-alone electronics device has been designed, it determines the photon number estimate in a receiver chain based on C-SPAD detector package. The device is interfaced to a station computer via conventional serial link.
Goals:

- to estimate the echo signal strength in laser ranging based on C-SPAD detector
- the SPAD chip current pulse risetime depends on photon number (Kirchner, Koidl, 1995)
- C-SPAD circuit provides two output timing pulses, their interval corresponds to the detected signal energy
- to construct the Time to Digital Converter to record the interval and hence the echo signal energy

C-SPAD Detector Package # 0406

Measured: Delay (Comp-Uncomp Output) with PPET

- avalanche build up time effect expanded by built-in circuit (G.Kirchner, F.Koidl)
- large data sets averaging

Indoor Calibration Tests

- compensated versus un-compensated output
- shot by shot data processing
- PET4 timing, NdYAG 32 ps @ 532 nm, indoor

- data spread ~ 50 ps rms
- \(>=\) ultimate photon number resolution 3x

1 PE 10 PE 100 PE 1000 PE
Time to Digital Converter for C-SPAD Based Energy Monitor

- REQUIREMENTS:
  - resolution 20 ps
  - range 8 bits / ~ 1.6 ns
  - dead time < 400 us

- DESIGNED CIRCUIT
  - time expander, capacitor charge / discharge
  - expansion factor ~ 2000 x
  - digital counter 30 / 15 ns on Programmable Gate Array

---

Time to Digital Converter Calibration

Indoor Laser Ranging Test
Prague, June 2, 2004, 2 kHz, 32 ps laser diode, C-SPAD, PET2k

- 1 PE 23 ps rms dark count
- 1 ~ 10 PE 23 ps
- ~ 100 PE 12 ps
- ~ 1000 PE 8 ps

Ground Target Laser Ranging Energy Spectrum
Graz, May 5, 2004, 2 kHz, 8 ps laser, C-SPAD, PET2k

- Dark counts / stability
  2 series, 24 hours apart
- 1 m ground target ranging
  1 - 10 PE, 15 ps rms
- 4 km ground target ranging
  ~ 1000 PE, 6 ps rms
Conclusion

- the C-SPAD based receiver package energy monitor has been constructed and tested

- FEATURES:
  - built in the PET2k
  - 7 energy levels resolution / shot - by - shot
    1-3, 3-10, 10-30, 30-100, 100-300, 300-1000, > 1000
  - self - calibrating /via dark counts on 1 PE/
  - temperature & temporal stability < 0.1 ch / day

- STAND BY device of the C-SPAD energy monitor has been constructed and is available for SLR stations operating C-SPAD
