

Session 7: SLR Technology and Synergy

4 Talks in Session: Co-location, dual color and satellite spin

Jan: NGS LR fully operational and co-location completed
(replication process in sight; 2015!)

Erricos: Co-location between NGS LR and Moblas7 consistent to
within 3 mm

Stanislaw: Analysis on the existing 2-color passes showed, that
there might be a difference, but the data does not support
conclusions (systematics vs. refraction model deficiencies)

Daniel: The procedures to model satellite spin have been
developed over the past years - now it has to be applied
